By studying this diagram, technicians and engineers can better grasp how the system operates under various conditions.

Key Components in the Diagram

The diagram highlights several critical parts, each with a specific role:

1. **Air Compressor:** Provides the compressed air necessary for the system's operation.
2. **Air Reservoirs (Air Tanks):** Store compressed air for immediate use in braking applications.
3. **Brake Pedal/Control Valve:** Initiates the braking process when pressed.
4. **Air Lines and Hoses:** Transport compressed air from the reservoirs to various components.
5. **Air Brake Valve (or Relay Valve):** Controls the release of compressed air to actuate the hydraulic system.
6. **Hydraulic Master Cylinder:** Converts hydraulic pressure into brake force, actuating the brake calipers or drums.
7. **Hydraulic Lines:** Convey hydraulic fluid to brake components.
8. **Brake Actuators (Calipers or Wheel Cylinders):** Apply force to the brake pads or shoes to slow or stop the vehicle.
9. **Emergency and Service Lines:** Allow for redundancy and safety in braking operations.

Understanding how these components connect and interact is key to interpreting the **air over hydraulic brakes diagram** effectively.

Working Principle of Air Over Hydraulic Brakes

The core of the system lies in its ability to use compressed air to generate hydraulic pressure, which then applies the brakes. The diagram helps visualize this process step-by-step.

Step-by-Step Operation

1. **Brake Application:** When the driver presses the brake pedal, a control valve is activated.
2. **Air Signal Generation:** The control valve releases compressed air from the reservoirs into the relay valve or directly to the brake chambers.
3. **Air to Hydraulic Conversion:** The relay valve opens, allowing compressed air to act upon a hydraulic piston

or chamber connected to the master cylinder.

4. **Hydraulic Pressure Build-Up:** The air pressure pushes the hydraulic piston, generating hydraulic pressure within the master cylinder.
5. **Brake Actuation:** Hydraulic fluid flows through lines to the wheel cylinders or calipers, applying brake pads or shoes against the drum or disc.
6. **Deceleration:** The friction between brake components slows down or stops the vehicle.
7. **Release of Brakes:** Releasing the brake pedal cuts off the air supply, causing the relay valve to vent air and hydraulic pressure to dissipate, releasing the brakes.

This seamless conversion from air pressure to hydraulic force allows for efficient and powerful braking, especially suitable for heavy-duty applications.
