Fundamental Concepts of Cell Transport Before delving into the specifics of the worksheet, it's essential to understand the core concepts of passive and active transport.

What Is Passive Transport? Passive transport is the movement of molecules across the cell membrane without the use of cellular energy (ATP). It relies on the natural kinetic energy of molecules and their concentration gradients.

Key features of passive transport:

- No energy required.
- Moves molecules from high to low concentration (down the concentration gradient).
- Includes processes such as diffusion, osmosis, and facilitated diffusion.

What Is Active Transport? Active transport involves the movement of molecules against their concentration gradient, from low to high concentration, requiring energy input.

Key features of active transport:

- Requires energy, usually in the form of ATP.
- Moves molecules against the concentration gradient.
- Involves specialized transport proteins like pumps.

Types of Passive Transport Understanding passive transport involves exploring its main types:

- Diffusion** The spontaneous movement of molecules from an area of higher concentration to an area of lower concentration until equilibrium is reached. Examples: - Oxygen entering lung cells. - Carbon dioxide exiting cells.
- Osmosis** The diffusion of water molecules across a selectively permeable membrane from a region of lower solute concentration to higher solute concentration. Key points: - Water moves to balance solute concentrations. - Critical for maintaining cell turgor and volume.
- Facilitated Diffusion** The movement of molecules across the cell membrane via specific transport proteins, often for molecules that cannot diffuse directly through the lipid bilayer. Examples: - Glucose entry into cells. - Amino acids transport.

Types of Active Transport Active transport can be categorized into several mechanisms:

- Protein Pumps** Transport proteins that use ATP to change shape and move substances against their concentration gradient. Example: - Sodium-potassium pump (Na^+/K^+ pump), which maintains cellular ion balance.
- Endocytosis and Exocytosis** Processes that involve the bulk transport of large molecules or particles: - Endocytosis: Cell engulfs substances into vesicles. - Exocytosis: Vesicles fuse with the membrane to release substances outside the cell.
