Foundations of Cellular Neurophysiology Understanding the cellular basis of nervous system function is fundamental to the study of neuroscience. The foundations of cellular neurophysiology encompass the structural components, electrical properties, and biochemical mechanisms that enable neurons to process and transmit information. This knowledge provides insights into how signals are generated, propagated, and integrated within the nervous system, underpinning everything from basic reflexes to complex cognitive functions.

Introduction to Neurons and Glial Cells

Neurons are the primary signaling units of the nervous system, specialized for transmitting electrical and chemical signals. Supporting cells, known as glia, play crucial roles in maintaining neuronal health and modulating neural activity.

Neurons: Structural and Functional Overview

Neurons have distinct morphological features:

1. **Cell Body (Soma):** Contains the nucleus and most organelles; integrates synaptic inputs.
2. **Dendrites:** Branching structures that receive synaptic signals from other neurons.
3. **Axon:** Conducts electrical impulses away from the soma toward target cells.
4. **Axon Terminals:** Synaptic boutons that release neurotransmitters to communicate with postsynaptic cells.

Glial Cells and Their Roles

Glia are non-neuronal cells that support and modulate neuronal activity:

1. **Astrocytes:** Maintain extracellular ion balance, regulate neurotransmitter levels, and support blood-brain barrier integrity.
2. **Oligodendrocytes and Schwann Cells:** Form myelin sheaths around axons, facilitating rapid signal conduction.
3. **Microglia:** Act as immune cells within the CNS, clearing debris and responding to injury.

Electrical Properties of Neurons

The core of cellular neurophysiology involves understanding how neurons generate and propagate electrical signals.

These electrical properties are rooted in the cell membrane's ability to maintain and alter its electrical potential.

Membrane Potential and Resting State

The membrane potential is the voltage difference across the neuronal membrane, primarily established by the unequal distribution of ions inside and outside the cell.

1. **Resting Membrane Potential:** Typically around -70 mV, maintained by ion gradients and active transport mechanisms.
2. **Electrochemical Gradient:** The combination of electrical and chemical forces that drive ion movement.

Ion Channels and Their Functions

Ion channels are integral membrane proteins that regulate ion flow:

1. **Voltage-Gated Channels:** Open in response to changes in membrane potential; crucial for action potential generation.
2. **Ligand-Gated Channels:** Open upon binding specific

neurotransmitters; mediate synaptic transmission.

3. **Mechanically Gated Channels:** Respond to physical deformation of the membrane.

Resting Membrane Conductance and Ion Permeability

At rest, the neuron's membrane is more permeable to potassium (K^+) than sodium (Na^+). This permeability difference is essential for establishing the resting potential.

Generation and Propagation of Action Potentials

The action potential is the fundamental electrical signal that neurons use to communicate over long distances.

Initiation of Action Potential

An action potential is triggered when a stimulus depolarizes the membrane beyond a certain threshold (typically around -55 mV), primarily due to the opening of voltage-gated sodium channels.

Phases of the Action Potential

The action potential occurs in distinct phases:

1. **Depolarization:** Rapid influx of Na^+ ions causes the membrane potential to become positive.
2. **Repolarization:** Voltage-gated K^+ channels open, allowing K^+ to exit, restoring negative potential.
3. **Hyperpolarization:** K^+ channels remain open slightly longer, making the membrane more negative than the resting potential.
4. **Return to Resting State:** Ion channels close, and the sodium-potassium pump restores original ion distributions.

Propagation of Action Potentials

The electrical impulse travels along the axon via a process called saltatory conduction (in myelinated fibers) or continuous conduction (in unmyelinated fibers). Myelin sheaths increase conduction velocity by insulating segments of the axon, enabling rapid signal transmission.

Synaptic Transmission and Neurochemical Signaling

Communication between neurons occurs at synapses, where electrical signals are converted into chemical signals.

Chemical Synapses

At chemical synapses:

1. Action potentials arrive at the presynaptic terminal.
2. Voltage-gated calcium channels open, allowing Ca^{2+} influx.
3. Calcium triggers vesicle fusion and neurotransmitter release.
4. Neurotransmitters bind to receptors on the postsynaptic membrane, modulating its activity.

Neurotransmitter Receptors and Post-Synaptic Potentials

Receptors can be classified as:

1. **Ionotropic Receptors:** Ligand-gated ion channels that produce fast postsynaptic potentials.
2. **Metabotropic Receptors:** G-protein coupled receptors that modulate cellular processes indirectly, leading to slower responses.

Post-synaptic potentials include:

1. **Excitatory Post-Synaptic Potentials (EPSPs):**
Depolarize the membrane, increasing likelihood of firing an action potential.
2. **Inhibitory Post-Synaptic Potentials (IPSPs):**

Hyperpolarize the membrane, decreasing firing probability.

Neuronal Integrative Functions

Neurons integrate multiple synaptic inputs to generate appropriate responses.

Summation of Synaptic Inputs

Neurons perform two types of summation:

1. **Spatial Summation:** Simultaneous inputs from multiple synapses on different parts of the neuron.
2. **Temporal Summation:** Repeated inputs arriving in quick succession at the same synapse.

The combined effect determines whether the neuron reaches the threshold to fire an action potential.

Neuronal Plasticity

The strength of synaptic connections can change over time, a phenomenon known as plasticity. This underpins learning and memory.

Biochemical Mechanisms in

Neurophysiology

Cellular neurophysiology also involves complex biochemical processes that regulate neuronal function.

Ion Pumps and Maintaining Ion Gradients

The sodium-potassium pump actively transports 3 Na⁺ ions out and 2 K⁺ ions into the cell, maintaining resting potential and ion gradients essential for excitability.

Second Messenger Systems

Neurotransmitter binding can activate intracellular pathways involving molecules like cAMP, cGMP, and calcium, leading to long-term changes in neuron function.

Neurotransmitter Synthesis and Recycling

Neurons synthesize neurotransmitters from precursor molecules and recycle vesicles via endocytosis, ensuring efficient synaptic transmission.

In this comprehensive review, we delve into the core concepts, mechanisms, and components that form the foundation of cellular neurophysiology.

Introduction to Neurons and Neural Cells

Neurophysiology is rooted in studying neurons—the specialized excitable cells responsible for transmitting information throughout the nervous system. However, neurons are part of a broader cellular milieu that includes

glial cells such as astrocytes, oligodendrocytes, and microglia, which support and modulate neuronal activity.

Key Characteristics of Neurons: - Excitability: Ability to respond to stimuli and generate electrical signals. -

synapses. - Plasticity: Capacity to modify responses based on activity and experience. Types of Neural Cells: - Neurons:

Signal transmitting cells. - Glial cells: Support, insulate, and protect neurons.

Membrane Structure and Composition

The neuronal membrane provides the physical and chemical boundary essential for maintaining cellular homeostasis and facilitating electrical signaling. Lipid Bilayer: - Composed

primarily of phospholipids and cholesterol. - Acts as a semi-permeable barrier. - Provides fluidity and structural integrity.

adhesion molecules: Facilitate neuron connectivity.

Asymmetry: Membrane components are asymmetrically distributed, contributing to cell polarity and function.

Electrical Properties of Neurons

Neurons are electrically excitable, and their signaling relies on changes in membrane potential driven by ion movement. Several key electrical concepts underpin cellular neurophysiology: Resting Membrane Potential (RMP): - Typically around -70 mV. - Maintained primarily by the Na^+/K^+ -ATPase pump and leak channels. - Inside of neuron is negative relative to the outside. Action Potential: - A rapid, transient depolarization of the membrane. - Initiated when a threshold (around -55 mV) is reached. - Propagates along the axon to transmit signals. Graded Potentials: - Local changes in membrane potential that diminish with distance. - Involved in synaptic integration.

Ion Channels and Their Roles

Ion channels are fundamental to neuronal excitability, enabling selective ion fluxes that generate electrical signals. Types of Ion Channels: - Voltage-gated channels: Open/close in response to membrane potential changes. - Ligand-gated channels: Open upon binding specific neurotransmitters. - Mechanically gated channels: Respond to physical deformation. - Leak channels: Allow passive ion flow, establishing RMP. Synaptic Transmission:

Communication Between Neurons

Neuronal communication occurs at synapses, where electrical signals are converted into chemical signals, then back into electrical signals in the postsynaptic neuron. Types of Synapses: - Chemical synapses: Use neurotransmitters. - Electrical synapses: Use gap junctions for direct electrical coupling. Steps of Chemical Synaptic Transmission: 1. Action potential arrival: Depolarizes presynaptic terminal. 2. Neurotransmitter release: Ca^{2+} influx triggers vesicle fusion. 3. Neurotransmitter binding: Binds to receptors on postsynaptic membrane. 4. Post-synaptic response: Ion channels open or close, generating PSPs. 5. Neuronal Plasticity and Adaptation

Cellular neurophysiology also encompasses how neurons adapt over time: Synaptic Plasticity: - Changes in synaptic strength, underpinning learning and memory. - Types include long-term potentiation (LTP) and long-term depression (LTD). Intrinsic Plasticity: - Modifications to neuron excitability through channel regulation.
