The Fundamentals of Material Science

Structure of Materials

Materials are broadly categorized based on their internal structure:

1. Crystalline materials: Atoms arranged in an ordered, repeating pattern (e.g., metals, ceramics).
2. Amorphous materials: Lack long-range order (e.g., glass, polymers).
3. Composite materials: Combinations of two or more constituent materials to achieve desired properties.

Understanding these structures helps in predicting material behavior, such as strength, ductility, and conductivity.

Mechanical Properties

Key mechanical properties that determine a material's suitability for specific applications include:

1. Strength: Resistance to deformation or failure under load.
2. Ductility: Ability to deform plastically before fracture.
3. Hardness: Resistance to surface indentation or scratching.
4. Toughness: Ability to absorb energy before fracturing.
5. Elasticity: Ability to return to original shape after deformation.
