Practical Examples of Applied Mathematics Problems and Their Solutions

Let's explore some real-world problems and how they can be approached.

Example 1: Modeling Population Growth with Differential Equations

Problem: A biologist wants to model the growth of a bacterial population in a controlled environment. The growth rate depends on the current population size, and the population is expected to grow exponentially under ideal conditions. Solution Approach: - Use the exponential growth model: $\frac{dP}{dt} = rP$ where: - $P(t)$ is the population at time t , - r is the growth rate. - Solve the differential equation: $P(t) = P_0 e^{rt}$ where P_0 is the initial population. Application: By plugging in initial conditions and growth rates, the biologist can predict population size at future times, aiding in experiments and resource planning.

Example 2: Optimizing Production in Manufacturing

Problem: A factory produces two products, A and B. The profit per unit of A is \$40, and for B is \$50. The manufacturing process has constraints: - Material 1: up to 100 units available. - Material 2: up to 80 units available. - To produce one unit of A requires 2 units of Material 1 and 1 unit of Material 2. - To produce one unit of B requires 1 unit of Material 1 and 2 units of Material 2. Question: How many units of A and B should be produced to maximize profit? Solution Approach: - Define variables: $x = \text{units of A}$, $y = \text{units of B}$ - Set up the objective function: Maximize $Z = 40x + 50y$ - Constraints: $2x + y \leq 100$ (Material 1) $x + 2y \leq 80$ (Material 2) $x, y \geq 0$ - Use linear programming methods (graphical or simplex algorithm) to find the optimal solution. Result: By solving the LP problem, the factory can determine the optimal number of units for each product to maximize profit while respecting resource constraints.

Example 3: Data Analysis Using Regression

Problem: A researcher has data on advertising expenditure and sales revenue over 12 months. They want to understand how advertising impacts sales. | Month | Advertising (in \$100s) | Sales (in \$1000s) | |||| 1 | 5 | 50 | 2 | 6 | 55 | ... | ... | ... | 12 | 8 | 65 | Solution Approach: - Use linear regression to model sales as a function of advertising: $\text{Sales} = \beta_0 + \beta_1 \times \text{Advertising} + \epsilon$ - Fit the model using least squares estimation to find β_0 and β_1 . - Interpret the coefficients to understand the impact of advertising on sales. Application: The model can predict future sales based on planned advertising budgets

and help optimize marketing strategies.
