Core Concepts in Applied Hydrology Influenced by Chow and Maidment

Hydrological Cycle and Water Balance

Understanding the movement and distribution of water within a watershed is fundamental. The water balance equation: $P = ET + Q + \Delta S$ where: - P = precipitation - ET = evapotranspiration - Q = runoff or streamflow - ΔS = change in storage serves as the basis for analyzing hydrological processes. Chow emphasized empirical methods to quantify these components, while Maidment advanced computational approaches for precise data analysis.

Rainfall-Runoff Relationships

One of the core areas of applied hydrology involves understanding how rainfall translates into runoff. Chow developed dimensionless functions and empirical models, such as the unit hydrograph, to predict runoff patterns following storm events. Maidment's work enhanced these models through GIS integration, allowing for spatially distributed analyses and better prediction accuracy.

Flood Frequency and Routing

Flood risk assessment relies heavily on frequency analysis and routing models. Chow's research introduced methods for flood frequency estimation, including the Log-Pearson Type III distribution. He also contributed to flood routing techniques like the Muskingum method. Maidment extended these concepts by developing software tools and datasets that facilitate flood modeling and infrastructure design.

Hydrological Modeling and Simulation

Hydrological models simulate the movement of water within a watershed, accounting for rainfall, land use, soil properties, and more. Chow's early models provided simplified approaches, while Maidment's contributions include sophisticated, GIS-enabled models like HEC-HMS and HEC-RAS.

Practical Applications of Applied Hydrology
