Key Scientists and Their Contributions

- Gregor Mendel (1822-1884): Established the basic principles of heredity through his work on pea plants, introducing the concepts of dominant and recessive traits.
- Friedrich Miescher (1844-1895): Discovered a substance in the nuclei of white blood cells, calling it "nuclein," which was later identified as DNA.
- Phoebus Levene (1869-1940): Identified the components of nucleic acids, including sugar, phosphate, and nitrogenous bases, proposing the tetranucleotide structure.

The Race to Identify DNA as the Genetic Material

Streptococcus pneumoniae strains to show that dead virulent bacteria could transfer virulence to non-virulent strains. 2. Oswald Avery, Colin MacLeod, and Maclyn McCarty (1944): - Identified DNA as the "transforming principle" by showing that purified DNA could transfer genetic material. - Used enzymatic treatments to demonstrate that only DNA destruction prevented transformation. 3. Alfred Hershey and Martha Chase (1952): - Conducted the famous blender experiment with bacteriophages (viruses infecting bacteria). - Confirmed that DNA, not protein, was the genetic material transmitted by viruses.

The Structure of DNA: Unlocking the Code

Discoveries Leading to the Double Helix

- Understanding DNA's structure was crucial to comprehending its function and replication.

Key Scientists and Their Contributions

- Erwin Chargaff (1905-2002): - Discovered that the amount of adenine (A) equaled thymine (T), and cytosine (C) equaled guanine (G), known as Chargaff's rules. -
Rosalind Franklin (1920-1958): - Used X-ray diffraction to

capture images of DNA, producing the famous Photo 51, which revealed the helical structure. - James Watson (b. 1928) and Francis Crick (1916-2004): - Developed the double helix model of DNA in 1953, based on Franklin's images and other data. - Published their groundbreaking paper in Nature, describing the structure and pairing of nucleotide bases.

The Discovery of DNA Replication and Genetic Code

Understanding How DNA Copies Itself

- The elucidation of DNA replication mechanisms was essential for understanding heredity and mutation.

Major Contributions

- Matthew Meselson and Franklin Stahl (1958): - Demonstrated semi-conservative replication of DNA using isotopic labeling. - Marshall Nirenberg and J. Heinrich Matthaei (1961): - Deciphered the genetic code by synthesizing amino acids based on RNA sequences. - Crick, Brenner, and colleagues (1961): - Further clarified the nature of codons and how sequences of three bases encode amino acids.

The Impact of the Human Genome Project

The Evolution of DNA Knowledge: A Historical Perspective

Early Foundations: From Miescher to Griffith

The story of DNA begins in the late 19th century, when Swiss chemist Friedrich Miescher first isolated a substance from the nucleus of white blood cells in 1869. He termed this substance "nuclein," later identified as nucleic acid. Initially, scientists believed proteins were the hereditary material due to their complexity and abundance, overshadowing the nucleic acids. In the 1920s, Frederick Griffith's experiments with pneumococcal bacteria marked a turning point. His work demonstrated that genetic material could be transferred between bacteria, a process called transformation. Specifically, Griffith observed that non-virulent bacteria could acquire virulence when exposed to heat-killed virulent strains, suggesting some "transforming principle." Although the exact nature of this principle was unknown, it set the stage for future discoveries.

The Avery-MacLeod-McCarty Experiment: Identifying DNA as the Genetic Material

In 1944, Oswald Avery, Colin MacLeod, and Maclyn McCarty built upon Griffith's findings with their groundbreaking experiment. They isolated various molecules from heat-killed pathogenic bacteria and demonstrated that only when DNA was present could transformation occur. Their meticulous work provided strong evidence that DNA, rather than proteins, was the molecule responsible for heredity. This discovery was revolutionary, challenging the prevailing belief that proteins held the genetic blueprint. The Avery-MacLeod-McCarty experiment is often considered the first definitive proof that DNA is the hereditary material.

The Hershey-Chase Experiment: Confirming DNA as the Genetic Blueprint

Further validation came in 1952 from Alfred Hershey and Martha Chase. Their experiment used bacteriophages—viruses that infect bacteria—to demonstrate that DNA, not protein, enters bacterial cells and directs viral replication. They labeled DNA with radioactive phosphorus-32 and proteins with sulfur-35, observing that only the radioactive DNA entered the

bacteria, confirming DNA's role as the genetic material.

The Double Helix Structure: Watson and Crick's Landmark Discovery

While the experimental groundwork was laid, understanding DNA's structure was crucial. In 1953, James Watson and Francis Crick proposed the double helix model based on X-ray diffraction images produced by Rosalind Franklin and Maurice Wilkins. Franklin's Photo 51 provided critical insights into the helical structure, allowing Watson and Crick to elucidate how nucleotide bases paired through hydrogen bonds—a foundation for understanding replication and genetic coding.
