Overview of Cellular Components of the Immune System

The immune system comprises a diverse array of cells working collaboratively to defend the body against infectious agents and maintain immune homeostasis. **Abbas Cellular and Molecular Immunology** categorizes these cells into innate and adaptive immune cells, each with distinct roles and characteristics.

Innate Immune Cells

Innate immunity provides the first line of defense and includes cells that respond rapidly to pathogens without prior exposure.

1. **Macrophages:** Phagocytic cells that ingest and destroy microbes, also acting as antigen-presenting cells (APCs) to activate adaptive immunity.
2. **Neutrophils:** The most abundant white blood cells, essential for early microbial killing.
3. **Dendritic Cells:** Unique APCs that bridge innate and adaptive immunity by presenting antigens to T cells.
4. **Natural Killer (NK) Cells:** Lymphocytes that recognize and eliminate infected or transformed cells without prior sensitization.

Adaptive Immune Cells

Adaptive immunity provides a specific response tailored to particular pathogens, with memory for faster responses upon re-exposure.

1. **T Lymphocytes (T Cells):** Subdivided into helper T cells (CD4+) and cytotoxic T cells (CD8+), orchestrating immune responses and killing infected cells.
2. **B Lymphocytes (B Cells):** Responsible for antibody production, mediating humoral immunity.

Antigen Recognition and Immune Receptors

A cornerstone of **Abbas Cellular and Molecular Immunology** is understanding how immune cells recognize foreign substances—antigens—via specialized receptors.

Major Histocompatibility Complex (MHC) Molecules

MHC molecules present peptide fragments to T cells, enabling immune surveillance.

1. **MHC Class I:** Present peptides from intracellular pathogens to CD8+ T cells.
2. **MHC Class II:** Present extracellular pathogen-derived peptides to CD4+ T cells.

Antigen Receptors

The specificity of immune responses hinges on antigen receptors.

1. **B Cell Receptors (BCRs):** Membrane-bound immunoglobulins that recognize native antigens.

2. **Calcium Signaling:** Critical for T cell activation and cytokine production.
3. **NF- κ B Pathway:** Regulates gene transcription involved in immune responses, survival, and inflammation.

Co-stimulation and Signal Integration

Effective immune activation requires multiple signals, such as:

1. Signal through the TCR/MHC complex
2. Co-stimulatory signals, e.g., via CD28

Effector Functions of Immune Cells

The ultimate goal of immune activation is to eliminate pathogens and infected cells, mediated through various effector mechanisms.

Humoral Immunity

B cells produce antibodies that neutralize pathogens, facilitate phagocytosis, and activate complement.

1. Antibody classes (IgG, IgA, IgM, IgE, IgD) have distinct functions.
2. Antibody-dependent cellular cytotoxicity (ADCC) involves NK cells recognizing antibody-coated targets.

Cell-mediated Immunity

T cells and innate cells destroy infected cells directly or coordinate other immune responses.

1. CD8+ T cells induce apoptosis in infected cells via perforin and granzymes.
2. Helper T cells secrete cytokines to activate macrophages and B cells.

Immunological Tolerance and Autoimmunity

Maintaining immune tolerance is essential to prevent immune attacks on self-tissues. **Abbas Cellular and Molecular Immunology** discusses mechanisms ensuring self-tolerance, as well as the pathological states resulting from tolerance breakdown.

Central Tolerance

Occurs in the thymus and bone marrow, deleting self-reactive lymphocytes during development.

Peripheral Tolerance

Mechanisms such as anergy, suppression by regulatory T cells, and immune privilege prevent activation of self-reactive cells in the periphery.
